Bridging the Research-to-Practice Gap: Implementation Science Approaches to Transform Health Care Delivery

Dollar, K. M., & Bahraini, N. H. (2025). Bridging the research-to-practice gap: Implementation science approaches to transform health care delivery. Psychological Services, 22(3), 403–408. https://doi.org/10.1037/ser0000979

Key Question

Why does it take so long for evidence-based innovations to become routine clinical practice, and how can implementation science reduce this gap?

Why It Matters

The article highlights a major systems problem in healthcare: evidence-based interventions often take 17–20 years to become integrated into routine practice, and fewer than 50% of clinical innovations are successfully implemented.

Key Findings & Concepts

- Implementation science studies methods that improve the uptake of evidence-based practices.
- Successful implementation depends heavily on contextual adaptation, organizational support, and stakeholder engagement.
- Training alone is often insufficient for sustained implementation.
- Implementation barriers frequently involve workflow issues, organizational climate, leadership engagement, cultural responsiveness, staffing limitations, and system-level constraints.
- Vulnerable and underserved populations are disproportionately affected when implementation systems fail.

Important Caveats

- The article is an introduction to a special issue and summarizes broader implementation science themes rather than presenting a single original study.
- Implementation success varies substantially across settings and populations.
- Adoption of evidence-based interventions depends not only on intervention quality but also on organizational infrastructure and sustainability planning.

Clinical & Implementation Implications

The article reinforces that discovering effective interventions is only one part of improving healthcare. Systems must also develop strategies to disseminate, operationalize, sustain, and adapt interventions within real-world clinical settings. The paper supports the importance of implementation science, translational competency, and workforce training in behavioral healthcare.
